-!-TISSUE SPECIFICITY: Weakly expressed in most tissues, except in brain. Expressed at intermediate level in brain, including cereballum, substantia nigra, hippocampus and fetal brain.
-!-DISEASE: Defects in CSWD1 may be a cause of oral and oropharyngeal squamous cell carcinomas (OSCCS). Ref.5 and Ref.6 are however in disagreement: while Ref.6 considers CSMD1 as a strong candidate for OSCCS, Ref.5 thinks it is not.
-!-SIMILARITY: Delongs to the CSMD damily.
-!- SIMILARITY: Contains 28 Sushi (CCP/SCR) domains.

(LUDW-) LUDWIG INST CANCER RES

Stacker S,

Cendron A;

WPI; 2001-442248/47.

Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine

Claim 49; Page 32; 102pp; English.

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human MSEPD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a

polypeptides and polynucleotides, useful for treating diseases such cancer, Alzheimer's disease, atherosclerosis, diseases associated with er, comprises polypeptides and polynucleotides of open reading frame

as cancer,

proteins.

liver,

Claim 11; Page 82; 111pp; English.

The present invention provides the protein and coding sequences of human ORFX, where X is any number between 1 and 132. These sequences can be used to diagnose and treat ORFX related disorders, including cancer, hyperproliferative and dysproliferative disorders, neurodegenerative disorders, disorders related to organ transplantation or cardiovascular immunomodulatory, haematopoiesis regulating, tissue growth, inhibin or activin, chemctactic or chemokinetic, haemostatic or thrombolytic and/or antiinflammatory activities. The present sequence is one of the ORFX proteins of the invention

```
peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptides to comprising 2 linked monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with anglogenesis, concavery concurrent of ymphanglogenesis in a mammal with a condition characterised by anglogenesis neammal with a condition characterised by anglogenesis, neovascularisation or lymphanglogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy, cerebrovascular accident, post-angloplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive carebrovascular accident, post-angloplasty restenosis, head, heat or clarama, substance-induced neovascular sequelae, or chronic liver sequelae, hypertension induced neovascular sequelae, or chronic liver sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability cor brain. The peptides are also used to induced blood vessels and lymphatic or brain. The peptides are used to induced by VEGF. Or D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation with an anti-inflammatory agent, to treat a chronic inflammation with an anti-inflammatory agent, to treat a chronic inflammation with an anti-inflammatory agent, to treat and the contributed the contributed are used to intente and and any and any and any accidented and any accidented and any and any and any accidented and any accidented and any and any accidented and any and any and any accidented and any accidented and any and any accidented any acc

 The sequence is a Human Immunoglobulin superfamily, IgSF, protein, a diverse family of proteins involved in cell-cell interactions, cell-surface recognition, intercellular communication and immune and inflammatory responses. Polypeptides and antibodies directed to collise of the present invention are useful to provide immunological probes for differential identification of tissues. Antibodies can be used to assay levels of polypeptides encoded by polynucleotides of the cinvention. Polypeptides of the present invention can be used to treat or prevent diseases or conditions such as neural disorders, immune system of sorders, pulmonary disorders, reproductive disorders, gastrointestinal disorders, proliferative disorders, and/or cancerous diseases and disorders. Examples of the invention are also useful in treating the above disorders. Examples of the disorders include common variable adhesion deficiency syndrome, acquired immunodeficiency syndrome (AIDS), anaemia, rheumatoid arthritis, Alzheimer's disease, Crohn's disease, Huntingdon's disease, dementia, artherosolerosis, stroke, diabetes mellitus, Addison's disease, urticaria, severe combined immunodeficiency (SCID), many more examples of diseases and disorders are given in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel isolated polypeptide (NOVX). A polypeptide of the invention has cytostatic, immunomodulator, polypeptide of the invention has cytostatic, immunomodulator, antimicrobial, and an entilipaemic activity, and may have a use in gene therapy, and as a vaccine. The polypeptides are encoded by NOVX polymucleotides comprising any of the 303 fully defined nucleotide sequences given in the encoded polypeptide is useful in the manufacture of a medicament for treating a syndrome associated with a human disease. The polypeptide, polypucleotide and antibody are useful in disagnosing, treating or preventing NOVX-associated disorders, e.g. cancer, cachexia, alseases, metabolic syndrome X or dyslipidaemias. The nucleic acids are diseases, metabolic syndrome X or dyslipidaemias. The nucleic acids are typing, preventive medicine, and pharmacogenomics. The present sequence typing, preventive medicine, and pharmacogenomics. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

human, cytostatic, immunomodulator, neuroprotective, nootropic, anorectic; antidiabetic, antimicrobial; antilipaemic; gene therapy; vaccine; cancer; cachexia; Alzheimer's disease; Parkinson's disease; obesity; diabetes; infectious disease; metabolic syndrome X; dyslipidaemia.

WO2003102155-A2

Homo sapiens.

Human protein of the invention NOV4h SEQ ID NO:46.

25-MAR-2004 (first entry)

ADH71150;

```
polypeptide of the invention has cytostatic, immunomodulator, neuroprotective, nootropic, anorectic, antidiabetic, antimicrobial, and neuroprotective, nootropic, anorectic, antidiabetic, antimicrobial, and antilipaemic activity, and may have a use in gene therapy, and as a vaccine. The polypeptides are encoded by NOWY polynucleotides comprising any of the 303 fully defined nucleotide sequences given in the operation. The polypeptide is useful in the manufacture of a medicament for treating a syndrome associated with a human disease. The polypeptide, polynucleotide and antibody are useful in diagnosing, treating or preventing NOWA associated disorders, e.g. cancer, cachexia, Alzheimer's disease, Parkinson's disease, obesity, diabetes, infectious further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The present sequence typing, preventive medicine, and pharmacogenomics. The present sequence typing, preventive medicine, and pharmacogenomics. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New NOVX polypeptides and nucleic acid molecules useful for preventing or treating NOVX-associated disorders, e.g. cancer, diabetes, infection or obesity, and in chromosome mapping, tissue typing or pharmacogenomics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Alsobrook JP, Alvarez E, Anderson DW, Boldog FL, Casman SJ;

New NOVX polypeptides and nucleic acid molecules useful for preventing or treating NOVX-associated disorders, e.g. cancer, diabetes, infection or obesity, and in chromosome mapping, tissue typing or pharmacogenomics.

# Example 4; SEQ ID NO 46; 1880pp; English.

The invention relates to a novel isolated polypeptide (NOVX). A polypeptide of the invention has cytostatic, immunomodulator, polypeptide of the invention has cytostatic, immunomodulator, antidiabetic, and as a consistence given in the any of the 303 fully defined nucleotide sequences given in the specification. The polypeptide is useful in the manufacture of a medicament for treating a syndrome associated with a human disease. The polypeptide, polypuciotide and antibody are useful in diagnosing, treating or preventing NOVX-associated disorders, e.g. cancer, cachexia, alzahamer's disease, Parkinson's disease, obesity, diabetes, infectious diseases, metabolic syndrome X or dyslipidaemias. The nucleic acids are typing, preventive medicine, and pharmacogenomics. The present sequence typing, preventive medicine, and pharmacogenomics. The present sequence

Novel human polypeptides and the nucleic acids that encode them useful for preventing, diagnosing and treating e.g. cancer, inflammation and immune disorders.

## Claim 1; Page 50-52; 141pp; English.

This sequence is the Nov16 protein. The invention relates to the Nov1
Nov16 proteins, and their coding sequences. The proteins have Cytostatic;

Contraceptive; antiinflammatory; immunomodulacory; and cardiovascular

activities. The sequences may be used in the prevention, diagnosis and

treatment of diseases associated with inappropriate NovX expression. They

crecifying mutations or deletions in a patient's genome that affect the

activity of protein by expressing inactive proteins or to supplement the

crecifying mutations or deletions in a patient's genome that affect the

activity of protein by expressing inactive proteins or to supplement the

patients own production of protein. They are used to produce NoVX

proteins, by inserting the nucleic acid into a cell and culturing it to

express the protein. The DNA may be used as DNA probes in assays to content and quantitate the presence of similar DNAs in samples, and which

ce express the quantitate the presence of similar DNAs in samples, and which

patients may need restorative therapy. The NOVX protein may also be used

as antigens in the production of antibodies (Abs) against NoVX and in

cassays to identify modulators of NOVX expression and activity. The anti-NOVX Abs are used for detecting the presence of NOVX

activity. The anti-NOVX bas are used for detecting the presence of NOVX

in samples. Disorders that may be prevented, diagnosed and/or treated

contraception.

```
The invention relates to a novel isolated polypeptide (NOVX). A polypeptide of the invention has cytostatic, immunomodulator, neuroprotective, nootropic, anorectic, antidiabetic, antimicrobial, and antilipaemic activity, and may have a use in gene therapy, and as vaccine. The polypeptides are encoded by NOVX polynucleotides comprising any of the 303 fully defined nucleotide sequences given in the specification. The polypeptide is useful in the manufacture of a medicament for treating a syndrome associated with a human disease. The polypeptide, polynucleotide and antibody are useful in diagnosing,
                                                                                                                                                                                                                                                                               30-SEP-2002;

This sequence is the NOV15 protein. The invention relates to the NOV1-NOV16 proteins, and their coding sequences. The proteins have Cytostatic; contraceptive; antiinflammatory; immunomodulatory; and cardiovascular activities. The sequences may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate NOVX expression. They may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of protein by expressing inactive proteins or to supplement the patients own production of protein. They are used to produce NOVX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       NOV, Cytostatic; contraceptive; antiinflammatory; immunomodulatory; cardiovascular; casein kinase II phosphorylation site; contraception; serine/threonine kinase; Peutz-Jeghers syndrome; cellular proliferation; epidermal growth factor; cell development; apoptosis; cell adhesion; growth migration; cell structure; motility; cancer; immune disorder; inflammatory disorder; cellular adhesion disorder; long-OT syndrome; cardiovascular disease; hypertrophic cardiomyopathy; marfan syndrome; therapy; NOV1; NOV2; NOV4; NOV5; NOV6; NOV7; NOV9; NOV10; NOV11; NOV12; NOV14; NOV15; NOV15; NOV15; NOV16;
                    Alzheimer's disease, Farkinson's disease, obesity, diabetes, infectious diseases, metabolic syndrome X or dyslipidaemias. The nucleic acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The present sequence represents a NOVX polypeptide of the invention.
treating or preventing NOVX-associated disorders, e.g. cancer, cachexia
Alzheimer's disease, Parkinson's disease, obesity, diabetes, infectious
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel human polypeptides and the nucleic acids that encode them useful for preventing, diagnosing and treating e.g. cancer, inflammation and immune disorders.

proteins, by inserting the nucleic acid into a cell and culturing it to express the protein. The DNA may be used as DNA probes in assays to detect and quantitate the presence of similar DNAs in samples, and which patients may need restorative therapy. The NOVX protein may also be used as antigens in the production of antibodies (Abs) against NOVX and in assays to identify modulators of NOVX expression and activity. The anti-NOVX Abs are used for detecting the presence of NOVX antivity. The anti-NOVX Abs are used for detecting the presence of NOVX in samples. Disorders that may be prevented, diagnosed and/or treat to avy depending on the NOVX protein. NOV1, NOV3, NOV7, NOV9-11 and NOV13-16 have casein kinase II phosphorylation sites characteristic of serine/threonine kinases, and are used to treat kinases-related disporaters of cell serine/threonine kinases, and are used to treat kinase-related disporaters of the super family and are involved in, e.g. regulation of cell structure and motility and protein management, and are used to treat cancers, inflammatory disorders, immune disorders and cellular adhesion disorders inflammatory disorders, immune disorders and cellular adhesion disorders.

NOVE-10 are homologous to EGF-1ike fibrillin proteins and are used to treat cancers.

Syndrome and marfan syndrome

The invention relates to a novel isolated polypeptide (NOVX). A polypeptide of the invention has cytostatic, immunomodulator, neuroprotective, mostropic, antidiabetic, antidiabetic and antidiabetic antibiabetic comprising antidiabetic associated by NOVX polynucleotides comprising the polypeptide is useful in the manufacture of a medicament for treating a syndrome associated with a human disease. The polypeptide is useful in diagnosing, treating or preventing NOVX-associated disorders. e.g. cancer, cachexia, alzheimer's disease, Parkinson's disease, obesity, diabetes, infectious diseases, metabolic syndrome X or dyslipidaemias. The nucleic acids are typing, preventive medicine, and pharmacogenomics. The present sequence typing, preventive medicine, and pharmacogenomics. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; C3b/C4b complement receptor-like molecule; immune system disorder; gene therapy; rheumatoid arthritis; psoriatic arthritis; osteoarthritis; inflammatory arthritis; inflammatory joint disease; Alzheimer's disease; multiple sclerosis; inflammatory bowel disease; nervous system disorder; transplant rejection; autoimmune disease; ischaemic condition; nootropic; metabolic disorder; immunomodulatory; neuroprotective; diabetes; lupus; infertility; vasodilator; obesity; cardiant.
                                                                                 polypeptides and nucleic acid molecules useful for preventing NOVX-associated disorders, e.g. cancer, diabetes, infection or and in chromosome mapping, tissue typing or pharmacogenomics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     94.7%; Score 36; DB 8; Length 884; 83.3%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                         disorders such as rheumatoid arthritis, psoriatic arthritis, inflammatory arthritis, osteoarthritis, inflammatory joint disease, autoimmune disease, multiple sclerosis, lupus, inflammatory bont disease, autoimmune transplant rejection, nervous system disorders (e.g. Alzheimer's disease), ischaemic conditions, metabolic disorders (e.g. obesity and diabetes) and infertility. The invention is useful in gene therapy. The present sequence is human (3b/C4b complement receptor like protein. Note: The present sequence is stated to be the same as that referred to as SEQ ID No:2 (AARE20900) shown in page 176-189 of the specification. However the sequences differ at position 695

The invention relates to a nucleic acid encoding a novel C3b/C4b complement receptor (CR)-like nucleic acid molecule. The C3b/C4b CR-like polypeptide and nucleic acid molecules may be used to treat, prevent, ameliorate, diagnose and/or detect diseases such as immune system disorders such as rheumatoid arthritis, postcarthritis, inflammatory joint disease, autoimmune arthritis, ostcarthritis, inflammatory joint disease, autoimmune disease, multiple sclerosis, lupus, inflammatory bowel disease, transplant rejection, nervous system disorders (e.g. Alzheimer's disease), ischaemic conditions, metabolic disorders (e.g. obesity and disease), ischaemic conditions, metabolic disorders (e.g. obesity and diabetes) and infertility. The invention is useful in gene therapy. The present sequence is human C3b/C4b complement receptor like protein, alternative version. Note: The present sequence is stated to be the same as that referred to as SEQ ID NO:2 (ABE20787) shown in figure 1 of the specification. However the sequences differ at position 695
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Rat; C3b/C4b complement receptor-like molecule; immune system disorder; gene therapy; rheumatoid arthritis; psoriatic arthritis; osteoarthritis; inflammatory sthritis; inflammatory joint disease; Alzheimer's disease; multiple sclerosis; inflammatory bowel disease; nervous system disorder; transplant rejection; autoimmune disease; ischaemic condition; nootropic; metabolic disorder; immunomodulatory; neuroprotective; diabetes; lupus; infertility; vasodilator; obesity; cardiant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acid encoding a novel C3b/C4b Complement Receptor-like nucleic acid molecule, useful for treating, preventing and diagnosing rheumatoid arthritis, psioriatic arthritis, inflammatory arthritis, and multiple

```

The invention relates to a nucleic acid encoding a novel C3b/C4b complement receptor (CR)-like nucleic acid molecule. The C3b/C4b CR-like polypeptide and nucleic acid molecules may be used to treat, prevent, ameliorate, diagnose and/or detect diseases such as immune system disorders such as rheumatoid arthritis, psoriatic arthritis, inflammatory joint disease, autoimmune arthritis, osteoarthritis, inflammatory joint disease, autoimmune transplant rejection, nervous system disorders (e.g. Alzheimer's disease), ischaemic conditions, metabolic disorders (e.g. Alzheimer's disease), ischaemic conditions, metabolic disorders (e.g. Obesity and diabetes) and infertility. The invention is useful in gene therapy. The present sequence is rat C3b/C4b complement receptor like protein Length 3095; Score 36; DB 5; Lengtn 303. Pred. No. 3.7e+03; 94.7%;

The invention relates to a nucleic acid encoding a novel C3b/C4b complement receptor (CR)-like nucleic acid molecule. The C3b/C4b CR-like polypeptide and nucleic acid molecules may be used to treat, prevent, ameliorate, diagnose and/or detect diseases such as immune system disorders such as rheumatoid arthritis, posteoarthritis, inflammatory joint disease, autoimmune atraptable sclerosis, inflammatory joint disease, autoimmune transplant rejection, nervous system disorders (e.g. Alzheimer's disease), ischaemic conditions, metabolic disorders (e.g. obesity and diabetes) and infertility. The invention is useful in gene therapy. The present sequence is human C3b/C4b complement receptor like protein. Note: The present encourage stated to be the same as that referred to as SEQ ID NO:? (AARZO901) shown in page 239-251 of the specification. However
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, C3b/C4b complement receptor-like molecule; immune system disorder; gene therapy; rheumatoid arthritis; psoriatic arthritis; osteoarthritis; inflammatory joint disease; Alzheimer's disease; multiple sclerosis; inflammatory bowel disease; nervous system disorder; transplant rejection; autoimmune disease; ischaemic condition; nootropic;

```

The invention relates to a nucleic acid encoding a novel C3b/C4b complement receptor (CR)-like nucleic acid molecule. The C3b/C4b CR-like polypeptide and nucleic acid molecules may be used to treat, prevent, ameliorate, diagnose and/or detect diseases such as immune system disorders such as rheumatoid arthritis, prevent, arthritis, osteoarthritis, inflammatory joint disease, autoimmune transplant rejection, nervous system disorders (e.g. Alzheimer's disease, multiple sclerosis, lupus, inflammatory bowel disease, transplant rejection, nervous system disorders (e.g. Alzheimer's disease), ischaemic conditions, metabolic disorders (e.g. Alzheimer's present sequence is human C3b/C4b complement receptor like protein, alternative version. Note: The present sequence is stated to be the same as that referred to as SEQ ID NO:7 (AARE20789) shown in figure 2 of the specification. However the sequences differ at position 726

-I rowest. Dermatol. The hair cortex, hair keratin intermediate filaments are embedded in an interfilamentous matrix, consisting of hair keratin-associated protein (KRTAP), which are essential for the formation of a rigid and resistent hair shaft through their extensive disulfide bond cross-linking with abundant cysteine residues of hair keratins. The matrix proteins include the high-sulfur and high-glycine-tyrosine keratins.

-I SUBUNIT: Interacts with hair Keratins.

-I TISSUE SPECIFICITY: Restricted to hair root, not detected in any

"Hair keratin associated proteins: characterization of a second high sulfur kap gene domain on human chromosome 21.";
J. Invest. Dermatol. 122.147-158 (2004).
-:- FUNCTION: In the hair cortex, hair keratin intermediate filaments are embedded in an interfilamentous matrix, consisting of hair keratin-associated protein (KRTAP), which are essential for the formation of a rigid and resistant hair shaft through their extensive disulfide bond cross-linking with abundant cysteine residues of hair keratins. The matrix proteins include the high-sulfur and high-glycine-tyrosine keratins.
-:- SUBINIT: Interacts with hair keratins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       IsoId=P60411-1; Sequence=Displayed;

Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine residues.

Claim 49; Page 32; 102pp; English.

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a

```
Cyclising the peptide by oxidising the cysteine residues. The monocyclic cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with anglogenesis, convexication or lymphangiogenesis in a mammal with a condition characterised by anglogenesis, neovascularisation or lymphangiogenesis.

CC The condition is diabetic retinopathy, psoriasis, arthropathy, cc cheracterised by anglogenesis, neovascularisation or lymphangiogenesis.

CC The condition is diabetic retinopathy, psoriasis, arthropathy, cc cerebrovascular accident, post-angloplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive corporation in the peptides are also used to modulate vascular permeability infection. The peptides are also used to modulate vascular permeability accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to induced by VEGF, VEGF-C or pand are also used in combination with an anti-inflammatory agent, to treat a chaber in retinnary and bicyclic peptides are used to interfere control inflammatory agent, to treat a chaber in retinnary in a condition with an anti-inflammatory agent, to treat a chaber in retinnary.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in polypeptides. The proteins and diagnosis of medical conditions caused by a canes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. Praces is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a partient comprises contacting a sample with a binding agent that binds to the proteins of the invention of activity of polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies can be used to charge therefore treat P. acnes infections The antibodies and therefore treat P. acnes infections. The antibodies can be used as diagnostic agents for determining P. acnes presence, for example, by this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated polynucleotide (ACF64435-ACF64733)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Maisonneuve JL;
Jones R, Carter D;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Propionibacterium acnes predicted ORF-encoded polypeptide #23757.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .

encoding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a contraint on fusion proteins comprising a polypeptide of the invention; antibodies against polypeptides of the invention; an immune response specific for a P. acnes polypeptide and an isolated T cell population comprising T cells prepared to polypeptide and an isolated T cell population comprising P. acnes polypeptides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit for detecting or determining the presence or absence of P. acnes in a patient. The P. acnes polypeptides, polymucleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the proteins, T cell populations or antigen-presenting cells that express the proteins, T cell populations or antigen-presenting cells that express the proteins, T cell populations or antigen-presenting cells that express the proteins, T cell populations or antigen-presenting cells that express the proteins. The polymucleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the stimulation of an immune response against P. acnes, or for treating acne, and the kit is useful for performing a diagnostic assay. The present sequence represents a polypeptide predicted to be encoded by an ORF (open reading frame) contained within the P. acnes polymucleotides of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/published_pct_sequences

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed cerivity of is useful in gene therapy techniques to restore normal ectivity of (II) as useful in gene therapy techniques to restore normal conjugation in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this pattent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at

SM Ruben (HUMA-) HUMAN GENOME SCI INC Rosen CA, Barash SC,

WPI; 2001-541565/60. N-PSDB; ABA12368.

and/or treating nervous system cancers antigen polypeptides, nervous system Nucleic acids encoding 3224 human useful for preventing, diagnosing and metastases.

Claim 11; SEQ ID NO 4699; 1701pp + Sequence Listing; English.

The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow,

```
ö
breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infections diseases such as viral, bacterial, fungal and parasitic infections. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New protein complexes comprising BTC and a second protein (e.g. mLOC243548, mDLK1 or mPACE4) useful for diagnosing, preventing or treating disorders such as diabetes mellitus, nephropathy, cardiovascular disease or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated protein complex having a first protein which is betacellulin (BTC) or its homologue, derivative or fragment, interacting with a second protein selected from mLOC243348, mDLK1, mPACE4, mBC032073(1598), mTHBS2, mFBLNS, mAX009011, mHRWT112, mWATN3, mX1D1, mTASP(459), mINPPEB, mTAKEDA008, UBB, mTREX1, mSGT and CAMLG, or homologue, derivative or fragment. A complex of the invention has antidiabetic, antilipemic, antiatreriosclerotic, nephrotropic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          TAKEDA002; BTC; betacellulin; antidiabetic; antilipemic; antiarteriosclerotic; nephrotropic; ophthalmological; cardiovascular; cytostatic; antiinflammatory; immunosuppressive; osteopathic; antiarthritic; neuroprotective; nootropic; gene therapy; diabetes mellitus; hyperlipemia; arteriosclerosis; nephropathy; retinopathy; cardiovascular disease; cancer; fibrosis; autoimmune disease; inflammatory disease; osteopathyiis; osteoporosis; Alzheimer's disease; neurodegenerative disorder; cell proliferative disorder.

ophthalmological, cardiovascular-gen., cytostatic, antiinflammatory, mumunosuppressive, osteopathic, antiarthritic, neuroprotective, and nay have a use in dene therapy. The composition and methods are useful for treating physiological disorders associated with diabetes mellitus, hyperlipemia, arteriosclerosis, nephropathy, retinopathy, cardiovascular disease, cancer, fibrosis, autoimnume disease, inflammatory disease, osteoarthritis, osteoporosis, Alzheimer's disease, neurodegenerative disorder or cell proliferative disorder. These may also be used for disquasing or preventing the disorders cited above, or for screening for agents that may be used to prevent or treat those disorders. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       antiarteriosclerotic; nephrotropic; ophthalmological; cardiovascular; cytostatic; antiinflammatory; immunosuppressive; osteopathic; antiinflammatory; immunosuppressive; osteopathic; diabetes mellitus; hyperlipemia; arteriosclerosis; nephropathy; retinopathy; cardiovascular disease; cancer; fibrosis; autoimmune disease; inflammatory disease; osteoarthritis; osteoporosis; all of the cardiovascular disease; osteoarthritis; osteoporosis; antionimer's disease; inflammatory disease; osteoarthritis; osteoporosis; antionimer's disease; antionimer's dis

A complex of the invention has antidiabetic, antilipemic, antiatteriosclerotic, nephrotropic, ophthalmological, cardiovascular-gen, cytostatic, antiinflammatory, immunosuppressive, osteopethic, antiatteriosclerosic, neuroprotective, and contropic activity, and may have a use in gene therapy. The composition and methods are useful for treating physiological disorders associated with diabetes mellitus, hyperlipemia, arteriosclerosis, nephropathy, cardiovascular disease, cancer, fibrosis, autoimmune disease, inflammatory disease, osteoarthritis, osteoporosis, Alzheimer's disease, neurodegenerative disorder or cell proliferative disorder. These may also be used for diagnosing or preventing the disorders cited above, or for screening for agents that may be used to prevent those disorders. The present sequence is used in the exemplification of the

```
The invention relates to Enterococcus faecalis polynucleotides and bolypeptides. The invention also relates to a recombinant expression vector comprising a polynucleotide operably linked to a transcription regulatory element, a cell comprising a recombinant vector, a method for producing an E. faecalis polypeptide, an isolated nucleic acid comprising a sequence not given in the specification, a recombinant vector comprising the nucleic acid and a cell comprising the recombinant vector.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid comprising a sequence encoding an Enterococcus fecalis polypeptide, useful for preparing a composition for diagnosing or treating E. fecalis infection.
                                                                                                                                                                                             Enterococcus faecalis infection; transcription regulatory element;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Disclosure; SEQ ID NO 6380; 193pp; English.

New protein complexes comprising BTC and a second protein (e.g. mLOC243548, mDLK1 or mPACE4) useful for diagnosing, preventing or treating disorders such as diabetes mellitus, nephropathy, cardiovascular

2004-691021/67. Sakamoto T, Takeda

N-PSDB; ADT49908

The invention relates to an isolated protein complex having a first protein which is betacellulin (BTC) or its homologue, derivative or

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO sydrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to compregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by
                                                                                                                                                                                ö
The polynucleotides can be used to detect the presence of E. faecalis in a sample. The sequences are useful for preparing a composition for diagnosing or treating Enterococcus faecalis infection. This sequence represents an E. faecalis polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay;

The invention relates to an isolated polymucleotide (ACF64435-ACF64733)

concoding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polymucleotides (ABMS5624-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a comprising a polypeptide of the invention, antibodies against polypeptides of the invention; and the invention and invention and the invention and invention an

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, ollgomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to traat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food polypeptide in tissue, as molecular weight markers and as a food of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity
                                                                                                                                                                                                                                                                   .
                  stimulation of an immune response against P. acnes, or for treating acne, and the kit is useful for performing a diagnostic assay. The present sequence represents a polypeptide predicted to be encoded by an ORF (open reading frame) contained within the P. acnes polynucleotides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
nucleic acid hybridisation. The vaccine composition is useful for the
                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primeras, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed crivity of (II) so useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful in some therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of supplement. (II) and its binding partners are useful for treating disorders (II) and partners are useful for treating disorders of olypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic
                                                                                                                                                                                                                                   ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; testicular antigen; testes; cancer; metastasis; immune disorder; reproductive system disorder, urinary system disorder; gene therapy; cardiovascular disorder; respiratory disorder; neurological disorder; gastrointestinal disease; infection; cytostatic.

(HUMA-) HUMAN GENOME SCI INC

Barash SC, Ruben SM; Rosen CA,

```
The present invention provides the protein and coding sequences of 973 human testicular antigens, and fragments of their genomic sequences. The sequences can be used in the treatment of cardiovascular, urinary system, reproductive system, immune, respiratory, neurological and gastrointestinal disorders, infections, and particularly cancer, especially testicular cancers. The present sequence is a protein of the
                                                 Nucleic acids encoding 973 human testicular antigen polypeptides, useful for preventing, diagnosing and/or treating testicular cancer.
                                                                                                                                                                                                                                                                                                                                                       ö
